1(d) By writing down the explicit gradient of log p(y|f<sub>n</sub>), make an argument that those training points 
$$x_i$$
 at which  $1|\hat{f}(x_i)| \gg 1$ , those "for from the decision boundary" do almost not contribute to this estimate  $\mathbb{F}_q[f(\cdot)]$ .

Ans:  $\nabla_{f_x} \log (p|y|f_x) = \sum_{i=1}^n \nabla_{f_x} \log (\sigma(y_i + \sigma_{i,2}))$ 

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i))) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log(1 + \exp(-y_i f(x_i)) \right]$$

$$= \sum_{i=1}^n \nabla_{f_x} \left[ -\log$$

$$\frac{\partial}{\partial f_{i}} - \log (1 + e^{x} p(-y_{i} f(x_{i}))) = \frac{y_{i} + 1}{2} - \sigma (f(x_{i}))$$

$$\nabla_{i} \log (p(y_{i} f_{x})) = \frac{y_{i} + 1}{2} - \sigma (f(x_{i}))$$

Now consider 
$$|\hat{f}_x| >> 1$$

$$O(|\hat{f}_x|) = \frac{1}{|1 + \exp(-|\hat{f}_x|)} = 1 \quad \text{as} \quad \lim_{n \to \infty} \exp(-n) = 0$$

$$|\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 0$$

Thus when  $|\hat{f}_x| = 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 0$ 

Thus  $|\hat{f}_x| = 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 0$ 

Thus  $|\hat{f}_x| = 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 1$ 

Similarly when  $|\hat{f}_x| = -1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad \text{and} \quad |\hat{f}_x| >> 1$ 

Vi log  $|\hat{f}_x| = -1 \quad \text{and} \quad |\hat{f}_x| >> 1 \quad$
